

# College Major Analysis

Shubhendu Dash

17/07/2020

## Regression Models:

The goal of the course is use regression analysis as tool to understand your data.

To achieve this objective, the course gives the tools to understand regressions, from the simple and practical linear model, to the glm, focussing on binary outcomes (logit) and count data (poisson).

## Optional Data Analysis Project:

This analysis is part of the optional quiz, to understand how students understand and work with data.

## A codebook for the dataset is given below:

1. rank: Rank by median earnings
2. major\_code: Major code
3. major: Major description
4. major\_category: Category of major
5. total: Total number of people with major
6. sample\_size: Sample size of full-time, year-round individuals used for income/earnings estimates:  
p25th, median, p75th
7. p25th: 25th percentile of earnings
8. median: Median earnings of full-time, year-round workers
9. p75th: 75th percentile of earnings
10. perc\_men: % men with major (out of total)
11. perc\_women: % women with major (out of total)
12. perc\_employed: % employed (out of total)
13. perc\_employed\_fulltime: % employed 35 hours or more (out of employed)
14. perc\_employed\_parttime: % employed less than 35 hours (out of employed)
15. perc\_employed\_fulltime\_yearround: % employed at least 50 weeks and at least 35 hours (out of employed and full-time)
16. perc\_unemployed: % unemployed (out of employed)
17. perc\_college\_jobs: % with job requiring a college degree (out of employed)
18. perc\_non\_college\_jobs: % with job not requiring a college degree (out of employed)
19. perc\_low\_wage\_jobs: % in low-wage service jobs (out of total)

## Data Analysis Process Starts:

1. Installing required packages.

1.1 To get started, start a new R/RStudio session with a clean workspace. To do this in R, you can

```
#This will load a data.frame called college for you to work with.

#install.packages("devtools")
#devtools::install_github("jhudsl/collegeIncome", force = TRUE)
library(collegeIncome)
data(college)

#Next download and install the matahari R package with the following commands.

#devtools::install_github("jhudsl/matahari", force = TRUE)
library(matahari)
```

1.2 This package allows a record of your analysis (your R command history) to be documented. You will

1.3 Before you start the analysis for this assignment, enter the following command to begin the document.

```
dance_start(value = FALSE, contents = FALSE)
```

2. Calling required packages from the library.

```
library(ggplot2)
```

```
## Warning: package 'ggplot2' was built under R version 4.0.2
```

```
library(dplyr)
```

```
## Warning: package 'dplyr' was built under R version 4.0.2
```

```
##
```

```
## Attaching package: 'dplyr'
```

```
## The following objects are masked from 'package:stats':
```

```
##
```

```
## filter, lag
```

```
## The following objects are masked from 'package:base':
```

```
##
```

```
## intersect, setdiff, setequal, union
```

```
library(GGally)
```

```
## Warning: package 'GGally' was built under R version 4.0.2
```

```
## Registered S3 method overwritten by 'GGally':
```

```
## method from
```

```
## +.gg ggplot2
```

3. Getting into the Analysis.

```
#Initial phase of data.frame analysis.
```

```
dim(college)
```

```
## [1] 173 19
```

```
str(college)
```

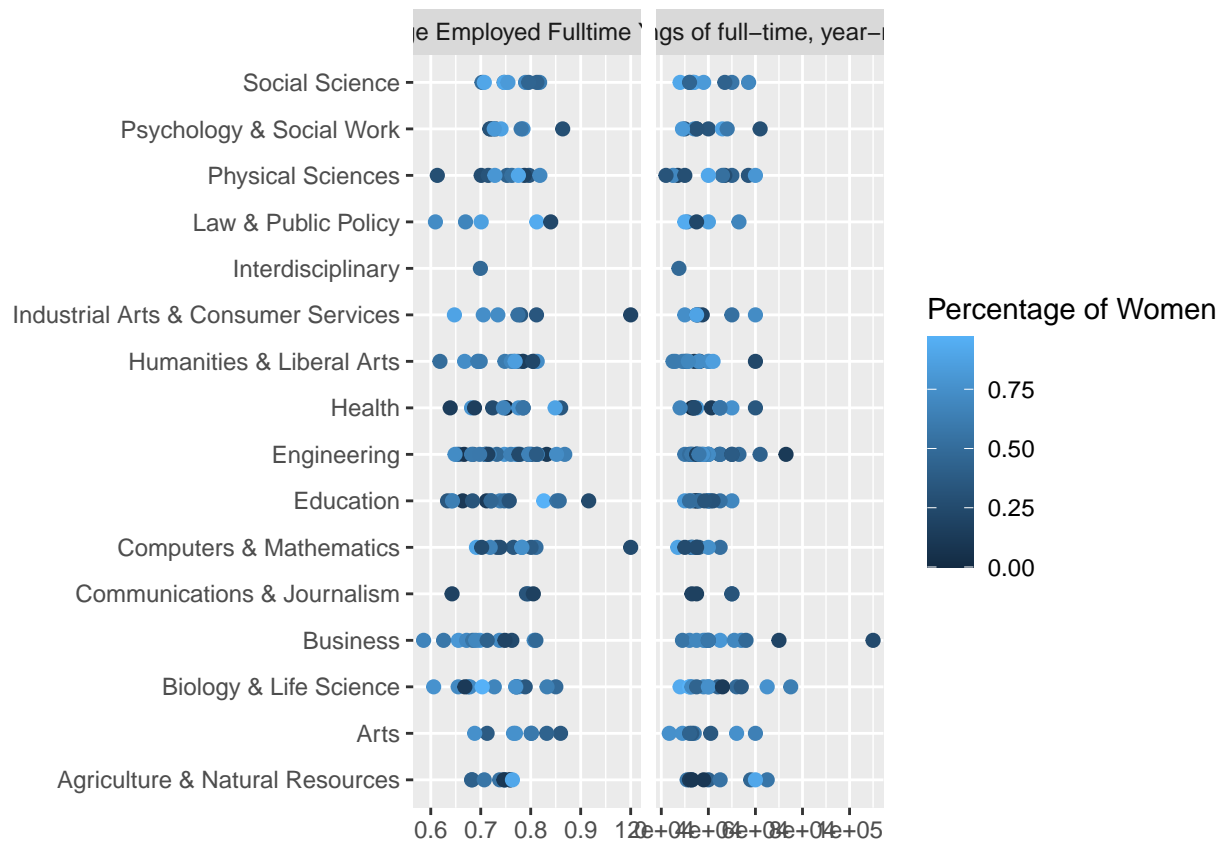

```
## 'data.frame': 173 obs. of 19 variables:
## $ rank : int 1 2 3 4 5 6 7 8 9 10 ...
## $ major_code : int 2419 2416 2415 2417 2405 2418 6202 5001 2414 2408 ...
## $ major : chr "Petroleum Engineering" "Mining And Mineral Engineering" "I
## $ major_category : chr "Engineering" "Engineering" "Engineering" "Engineering" ..
## $ total : int 2339 756 856 1258 32260 2573 3777 1792 91227 81527 ...
## $ sample_size : int 36 7 3 16 289 17 51 10 1029 631 ...

## $ perc_low_wage_jobs : num 0.0554 0.2156 0.0301 0.0432 0.118 ...
```

3.1 How's the distribution of fulltime employment? Is there a gender difference?

```
g <- ggplot(aes(perc_employed_fulltime_yearround, major_category, colour=perc_women), data=college)
g <- g + geom_point(size=2) + labs(x="Percentage Employed Fulltime Yearround", y="Major Category")
g <- g + scale_colour_gradient(name="Percentage of Women")
```

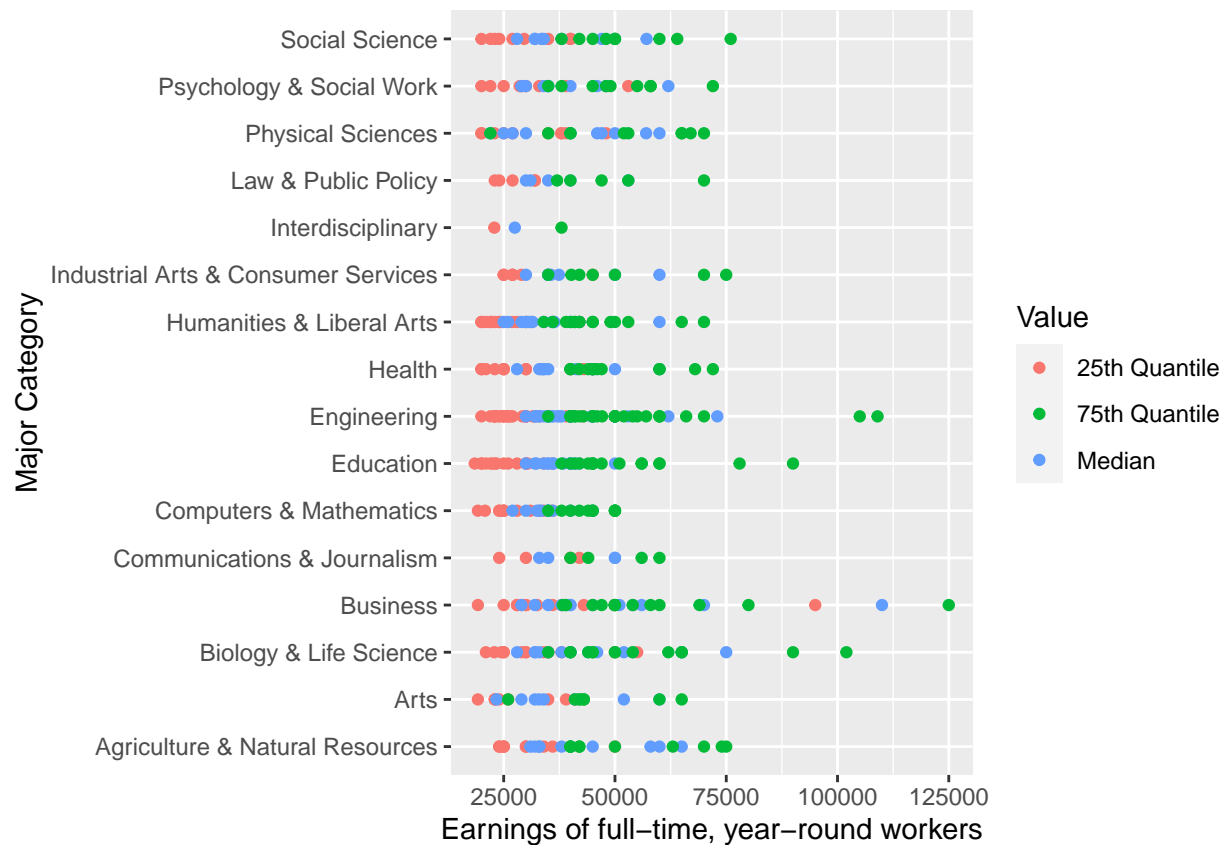

3.2 Is there a difference in the median of earnings?

```
h <- ggplot(aes(median, major_category, colour=perc_women), data=college)
h <- h + geom_point(size=2) + labs(x="Median earnings of full-time, year-round workers", y="Major Category")
ggmatrix(list(g, h), ncol=2, nrow=1, legend=grab_legend(g), xAxisLabels = c("Percentage Employed Fulltime", "Median Earnings of Full-time, Year-round Workers"))
```

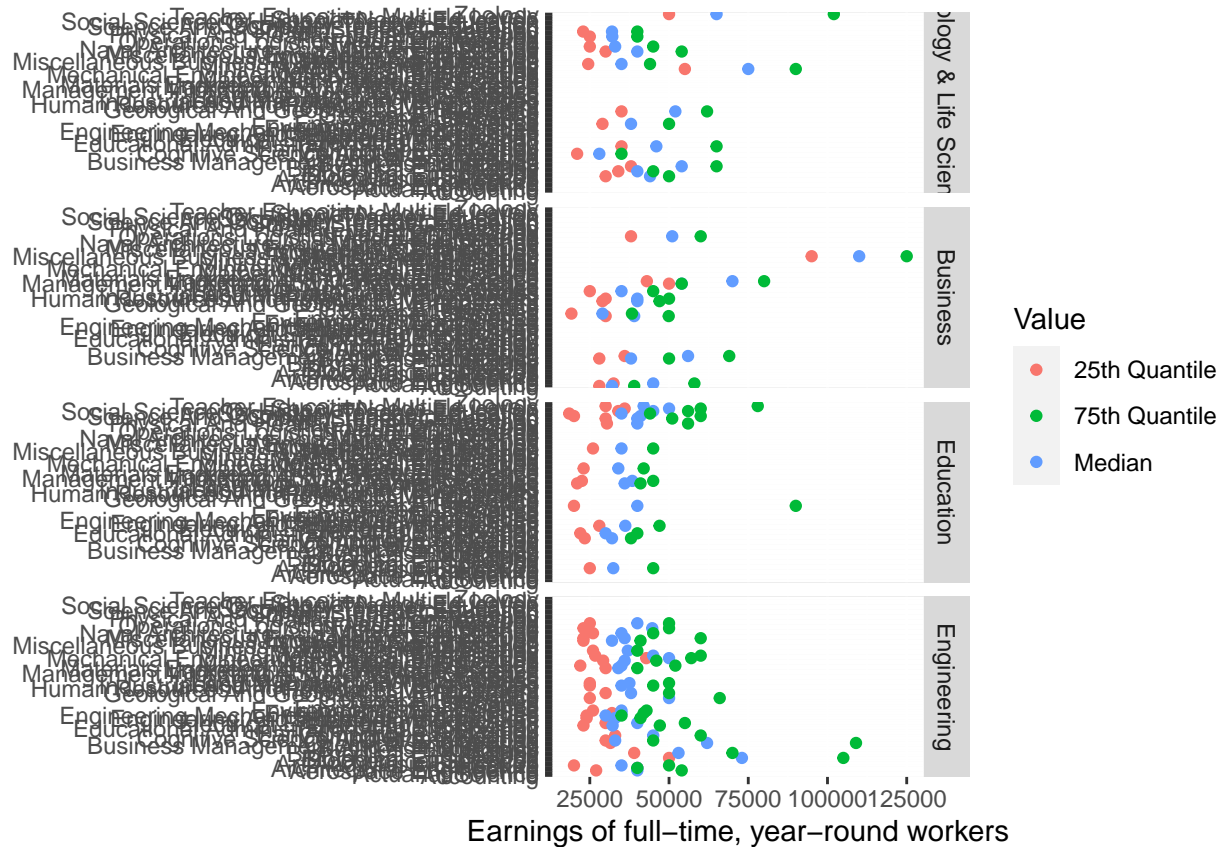

### 3.3 Looking median, 25th and 75th quintile of earnings.

```
p25th <- data.frame(Earnings = college$p25th, Major_category = college$major_category, Major = college$major_category)
median <- data.frame(Earnings = college$median, Major_category = college$major_category, Major = college$major_category)
p75th <- data.frame(Earnings = college$p75th, Major_category = college$major_category, Major = college$major_category)
earnings <- rbind(p25th, median, p75th)
m <- ggplot(aes(Earnings, Major_category), data=earnings)
m <- m + geom_point(aes(colour=Value)) + labs(x="Earnings of full-time, year-round workers", y="Major Category")
m #The higher earnings are Engineering, Education, Business and Biology & Life Science
```

3.4 Investigating these majors further.

```
big4 <- filter(earnings, Major_category=="Engineering" | Major_category=="Education" | Major_category=="B
1 <- ggplot(aes(Earnings, Major), data = big4) + facet_grid(Major_category ~ .)
1 <- 1 + geom_point(aes(colour = Value)) + labs(x="Earnings of full-time, year-round workers", y=NULL)
1
```

### 3.5 Looking at all the correlations.

```
all <- ggpairs(data = select(college, c(major_category, total, perc_women, median, perc_employed_fulltime)))
all
```

*#The model for the 75th quintile has a smaller adjusted p-value*

### 3.7 Conclusions.

- An interesting conclusion is that for 3 out of the 4 major categories investigated further,
- Education, Engineering, Business and Biology & Life Science, because of the high earnings, their interactions with the percentage of women in these areas were significant and their coefficients were negative. Looking at the graphic “h” it’s possible to visualize this effect.
- Even though this major categories appear to receive higher earnings, the greater the female participation in the area, the lower their gains.

### 3.8 Looking at the residuals.

```
par(mfrow=c(1,2))
plot(resid(fit), pch=16, col="deepskyblue4")
title("Residuals from median ~ major category")
abline(h=0, col="brown3", lwd=2)
plot(resid(fit4), pch=16, col="deepskyblue4")
abline(h=0, col="brown3", lwd=2)
title("Residuals from median ~ major category * percentage of women")
```

## Residuals from median ~ major cateom median ~ major category \* perc

*#The residuals for the model with the interaction are closer to zero, and appear random enough.*

```
fit7 <- lm(median ~ major_category*perc_women + perc_college_jobs + perc_employed + perc_low_wage_jobs,
summary(fit7))
```

```

## Conclusion:

- Including other variables doesn't bring much to the model, their coefficients are not significant and the  $R^2$  (and adjusted  $R^2$ ) and the F-statistic are slightly worse.
- The best model was the forth, with the interaction between the percentage of women and the major category.
- Some interesting coefficients are significant and the model and its F-statistic is able to reject the null hypothesis that all the coefficients are zero. But still, the effect is minimal, and the model doesn't explain much of the outcome.
- The first model, with only the major categories as regressors indicate that it does not affect the earnings.
